

Slate Isn't for Everyone

Aesthetics, longevity, and price are just a few of the factors to consider when choosing roofing material. Each of these decisions will impact the structure and the final medium that is chosen.

Slate is not a roof for the average project. Slate protects the integrity of the building and is held for the projects that value the durability of a roof. As a rock, slate has no added elements in the production of the tiles. Each tile is hand split at the quarry and then hand installed with 2 copper nails

Slate is not a roof for the average project, slate is for the building that is looking to stand for the next 100 years plus. The home, structure, monument that will hold significance for generations.

Slate is not a roof for the average project, slate is for the project that understands that plastic, rubber, or resin will never look or last like natural slate. Slate has proven its beauty as it ages like a monument strong, stoic with natural beauty.

Slate is not a roof for the average project, slate will cost more upfront, yet amortized over the lifespan of a roof, slate costs less than asphalt shingles.

Slate is meant for the projects that want to make a mark on our campuses, our pastoral countryside, and our skylines.

Slate is a PROVEN choice.
